

Dutch Electro

transport lighting

Company profile

Lighting solutions for every transport

Since 1988 Dutch Electro develops and manufactures light fittings, LED circuits boards and inverters for commercial vehicles. Our customers are the manufacturers of, for instance ambulances, fire trucks, freezing vans, market trucks, service vans, buses, trailers and several special applications. At the same time we supply our products to the marine industry. We also offer lighting solutions for industrial applications where for instance special voltages and compact designs are required. We permanently keep track of innovations in the lighting industry and apply these developments in our light fittings.

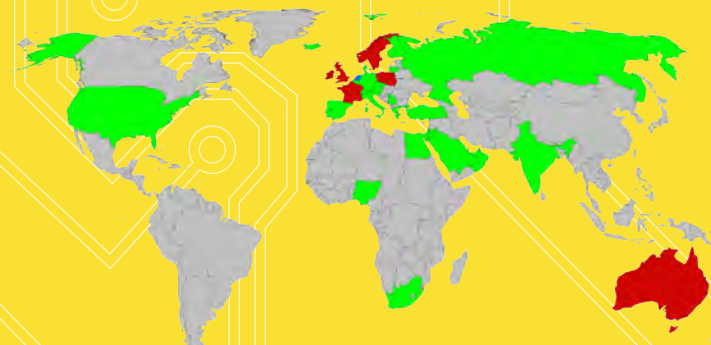

Custom made

Dutch Electro light fittings are known for their reliability, high light output and low power consumption. Our light fittings are assembled out of modules:

- aluminium or thermoplast base;
- polycarbonate diffuser;
- inverters for fluorescent lamps (12 or 24 VDC, 110 or 230VAC);
- LED light sources (10 – 30 VDC);

As the aluminium bases and the polycarbonate diffusers are extruded on lengths, we are able to manufacture light fittings in any requested length. A light fitting of for instance 6 meter long is not an exception. Furthermore we are able to supply special versions such as light fittings with double voltage, motion sensor, different light colors or dimmable lighting. You will find all standard versions of the Dutch Electro light fittings on our website. Additional information on special versions is available on request.

High quality

Dutch Electro lights are manufactured out of first class materials which comply with the latest European regulations such as REACH and RoHS. Our lights are designed and produced in the Netherlands according to the latest ISO 9001 standards. The materials we apply in our products are specially selected for use in commercial vehicles and have proven their functionality in difficult circumstances all over the world.

All Dutch Electro lights are officially certified for application in commercial vehicles (European EMC E4 directive).

Dutch design and production

Dutch Electro light fittings, LED circuit boards and inverters are developed in the Netherlands by Dutch designers and engineers. Also the production of the Dutch Electro light fittings is carried out from our factory in the Netherlands. After receiving your order we will assemble the requested light fittings. Manufacturing this way enables us to assemble light fittings on customer's specifications, with a short lead time.
